Summary

This document contains the specification for the SIARD file format version 2.1. SIARD stands for Software Independent Archival of Relational Databases. The format version 1.0 was developed by the Swiss Federal Archives, and the format is since being further developed by the community. It is a normative description of a file format for the long-term preservation of relational databases.

The SIARD format is based on standards including the ISO standards Unicode, XML, and SQL:2008, the URI Internet standard, and the industry standard ZIP. The aim of employing internationally recognised standards is to ensure the long-term preservation of, and access to, the widely used relational database model, as well as easy exchange of database content, independent of proprietary “dump” formats.

Relationship of the present version to previous versions:

eCH-0165 v1.0	→ Replaced Version 1.0 has been replaced by a more recent and current version. Its use remains possible, but it is recommended to use version 2.1.
eCH-0165 v2.0	→ Abrogated: Version 2.0 has been displaced because of errors and ambiguities that made an implementation impossible. This old issue must no longer be used, and either the new version 2.1 (that is already implemented[2]) or version 1.0 must be used.
SIARD-2.1	The present version 2.1 documents the current state of the SIARD file format. It has been developed by the eCH Fachgruppe on Digital Preservation but is no official standards by eCH.

[2] SIARD version 2.0 (2017) is supported by Siard Suite from release 2.0 onwards as well as by KOST-Val from release 1.8 onwards.

1 Introduction

1.1 Status

The document was approved by the Fachgruppe and can be implemented.

1.2 Area of application

1.2.1 Addressees / target group

This is a technical document for IT specialists involved in the long-term archiving of relational databases.

1.2.2 Background

The term “SIARD” stands for Software Independent Archival of Relational Databases. It is an open file format for the long-term archiving of relational databases in the form of text data based on XML that are packaged in a container file (SIARD archive)[3].

Long-term archiving is the preservation, normally without a time limit, of the information stored in the SIARD files while retaining the bit stream and the ability to interpret and display the data in a way that is human-readable and comprehensible.

If the structure and content of a relational database are translated into the SIARD format, it will subsequently be possible to access and exchange the data in the database at any time, even when the original database software is no longer available or can no longer be run. This has been achieved by the use of suitable standards for the SIARD format that are widely supported internationally. This long-term interpretability of the database content is essentially based on two standards: XML and SQL:2008.

[3] The SIARD database archiving format is distinct from the SIARD Suite application. This was developed by the Swiss Federal Archives SFA in order to generate and edit SIARD files and import them back into database environments

1.2.3 Distinctions

It should be noted that the SIARD format is only the long-term storage format for a specific type of digital documents (relational databases) and is therefore designed entirely independently of package structures such as the SIP (Submission Information Package), AIP (Archival Information Package) and DIP (Dissemination Information Package) in the OAIS model[4].

It is assumed that a database in SIARD format is archived as part of such an information package together with other documents (externalized large object files, translation maps for external file names, database documentation, business documents relevant to the understanding of the database, etc.).

Just as an XML-based Word or e-mail file contains an internal file structure consisting of metadata, primary data and various auxiliary data, an archived relational database in SIARD format contains its own metadata describing the document more precisely in addition to the actual table data – regardless of the metadata catalogue that an archive records in its OAIS packages.

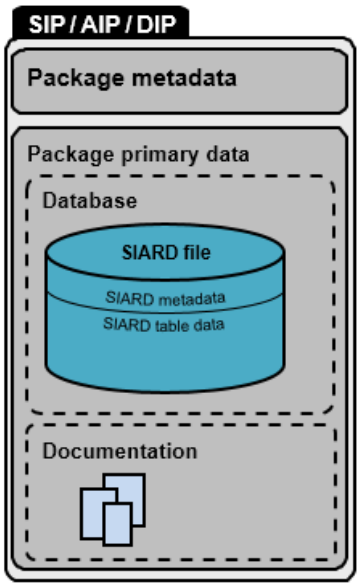

Fig. 1: Diagram of an information package containing a SIARD file

[4] http://public.ccsds.org/pubs/650x0m2.pdf.

2 Structure of the document

2.1 Structure of chapters

Each chapter in this Specification is constructed according to the same pattern. After a brief introduction, the requirements are listed in a table.

ID	Description of requirement	M/O
contains the ID of the requirement	contains the text of the requirement	stipulates whether mandatory or optional

A requirement is frequently further explained by means of recommendations, notes and examples, each of which is specifically indicated as such.

ID	Description of requirement	M/O
A_3.1-1	Text of requirement **Example** Text of example **Note** Text of note ***Recommendation*** *The text of recommendations is in italics.*	M

2.2 ID for requirements

The requirements are unambiguously identifiable by means of an ID.

ID
G_2.2-1

This ID is constructed according to the following pattern:

G_	Letter + _		identifies main chapters
	G_	=	General requirements / principles
	T_	=	Requirements for table data
	M_	=	Requirements for metadata
	P_	=	Requirements for package structure
2.1-1	The number begins with the number of the chapter (which groups together requirements on the same topic), and the number after the dash is consecutive, thus designating all the requirements in the chapter.		

2.3 Distinction between mandatory and optional requirements

Each requirement is either mandatory or optional. This is indicated by a letter:

Abbreviation	Meaning
M	Mandatory requirement This requirement must be met in order to obtain a valid SIARD file.
O	Optional requirement This requirement should be met. It simplifies handling and constitutes best practice.

2.4 Notation of folders, files and folder structures

The following symbols and parameters are used for the notation of folders, files, etc.

Symbol	Meaning
`/`	Folder
`header/`	A folder with the name “header”
`xy.txt`	File (with file extension “txt”)
`dir1/`	Example folders (in red)
`abc.pdf`	Example files (in red)
…	Placeholder for files or folders that are not relevant to the explanation
`[]`	Placeholder for an expression or basic type such as “string”, “integer”, etc.
`<xx>`	Placeholder for any desired string of characters

3 General requirements / principles

3.1 Use of standards

To ensure that the contents of a database remain interpretable over a long period, the SIARD format is essentially based on two ISO standards: XML and SQL:2008.

ID	Description of requirement	M/O
G_3.1-1	All database content is stored in a collection of files in XML 1.0 format[5] that conform to schema definitions according to XML Schema 1.0[6]. The schema definitions and SQL code must in each case conform to SQL:2008 in accordance with ISO/IEC 9075. The only exceptions are BLOB and CLOB data (Binary Large OBjects and Character Large OBjects) which are stored in separate binary and text files but are referenced in the XML files.	M

3.2 Databases as documents

A relational database is treated as a single document to be archived, so that the references between the data in individual tables are preserved.

ID	Description of requirement	M/O
G_3.2-1	A relational database is archived in a single SIARD file. This file may reference externally stored Large Objects that belong to the database in a larger sense.	M

3.3 Character sets and characters

ID	Description of requirement	M/O
G_3.3-1	All the data are stored in the Unicode character set in accordance with ISO 10646.	M
G_3.3-2	When extracting from databases that support other character sets, mapping to the corresponding Unicode character sets is carried out. For this reason, the national character string types (NCHAR, NCHAR VARYING, NCLOB) from the database product must generally be translated into non-national types (CHAR, VARCHAR or CLOB). This convention is supported by XML, irrespective of whether an XML file is stored in UTF-8 format or in UTF-16 format.	M
G_3.3-3	In the XML files in the SIARD format, all characters that have a special meaning in the XML syntax are replaced by unit references, of the type xs:string in all fields. Additionally, the Unicode control characters 0-31 and 127-159 are coded using the solidus ("\") to ensure that the validity of the XML file is guaranteed.	M

<table>
<tr><th>ID</th><th>Description of requirement</th><th>M/O</th></tr>
<tr><td>G_3.3-4</td><td>Characters that cannot be represented in UNICODE (codes 0-8, 14-31, 127-159), as well as the escape character '\' and multiple space characters are escaped as \u00<xx> in XML. Quote, less than and ampersand are represented in XML as entity references.

<table>
<tr><th>Original characters</th><th>Characters in the SIARD format</th></tr>
<tr><td>0 to 8</td><td>\u0000 to \u0008</td></tr>
<tr><td>14 to 31</td><td>\u000E to \u001F</td></tr>
<tr><td>32</td><td>\u0020, for multiple spaces</td></tr>
<tr><td>"</td><td>"</td></tr>
<tr><td>&</td><td>&</td></tr>
<tr><td>'</td><td>'</td></tr>
<tr><td><</td><td><</td></tr>
<tr><td>></td><td>></td></tr>
<tr><td>\</td><td>\u005c</td></tr>
<tr><td>127 to 159</td><td>\u007F to \u009F</td></tr>
</table></td><td>M</td></tr>
</table>

3.4 File URI Scheme

The file URI scheme used for referencing externally stored large objects is defined in RFC 1738[7].

ID	Description of requirement	M/O
G_3.4-1	All externally referenced files are specified using a file URI as specified in RFC 1738.	M
G_3.4-2	File URIs are stored as URL-encoded ASCII strings in a SIARD archive.	M
G_3.4-3	Externally stored Large Objects can be integrated into ZIP files if the file URI is based on a file system that allows addressing individual entries within a ZIP file. Thus.*file:///d:/sips/sip1234.zip* would refer to the ZIP file, whereas *file:///d:/sips/sip1234.zip/* refers to the root folder *inside* the ZIP file.	O

[7] http://en.wikipedia.org/wiki/File_URI_scheme , http://tools.ietf.org/html/rfc1738

3.5 Identifiers and regular identifiers

In SQL:2008 there are regular identifiers[8] excluding spaces and special characters which are not case-sensitive but are stored in upper case in the SIARD archive, and delimited identifiers which are case-sensitive and may also contain special characters or equal an SQL keyword. These must be quoted in double quotation marks in expressions. In the SIARD archive they are stored without the quotes.

The definition of what constitutes a special character or a keyword is set out in the SQL standard. The upper-case version of a letter is defined by the Unicode standard.

In the metadata, a regular identifier is stored in upper case, while all other identifiers are stored without quotation marks. The SQL:2008 standard stipulates that as soon as an identifier contains a character that is not permitted in a regular identifier or equals an SQL keyword, it is deemed to be a delimited identifier.

ID	Description of requirement	M/O
G_3.5-1	All identifiers are stored in the Unicode character set.	M
G_3.5-2	Regular identifiers are in upper case without quotation marks.	M
G_3.5-3	Delimited identifiers are stored without quotation marks.	M

[8] An SQL:2008 identifier must begin with a letter (A-Z) or an underscore (_) followed by letters (A-Z), numbers (0-9) or an underscore (_), with a maximum of 128 characters.

4 Requirements for the format structure

4.1 Construction of the SIARD archive file

The SIARD archive file is realised as a ZIP archive.

ID	Description of requirement	M/O
G_4.1-1	The SIARD file is stored as a single, ZIP archive in accordance with the specification published by the company PkWare, version 6.3.2[9].	M
G_4.1-2	SIARD files must either be uncompressed or else compressed using the "deflate" algorithm as described in RFC 1951[10]. ***Recommendation*** *It is advisable to use the deflate algorithm.*	M
G_4.1-3	The SIARD file is not password-protected or encrypted.	M
G_4.1-4	Both the ZIP32 and ZIP64 variants are permitted for the ZIP archive.	M
G_4.1-5	The ZIP archive has the file extension "`.siard`".	M

4.2 Structure of the SIARD archive file

A relational database archived in the SIARD format consists of two components: the metadata, which describe the structure of the archived database, and the table data, which represent the table content. The metadata also indicate where the various table data are to be found in the archive.

ID	Description of requirement	M/O

P_4.2-1	The table data are located in the `content/` folder and the metadata in the `header/` folder. No further folders or files are permitted.
	
	Example
	Structure of the SIARD file (schematic)
	`ech-0165_oe.siard`
	`content/`
	`header/`
		M

[9] ZIP files were originally defined by Phil Katz and are today extensively used as a de facto standard. The current version 6.3.2 of the specification published by PkWare can be found at https://support.pkware.com/display/PKZIP/Application+Note+Archives.

[10] https://www.ietf.org/rfc/rfc1951.txt

ID	Description of requirement	M/O
P_4.2-2	The `content/` folder contains one or more schema folders in which the individual table folders are located. No other folders or files are permitted. **Example** Structure of the SIARD file (schematic) **ech-0165_oe.siard** content/ schema0/ table0/ table1/ table2/ ... schema1/ table0/ ... ***Recommendation*** *It is advisable to normalise the schema and table folder names and to use, for example,* `schema0/` *and* `table0/` *instead of the actual name (see restrictions under P_4.2-5).*	M
P_4.2-3	The individual table folders contain an XML file and an XSD file, the names of which (folder designation and both file names) must be identical. With the exception of BLOB and CLOB folders together with their content (BIN, TXT, or XML files, or a file extension associated with the MIME type of the lob files in case this is known, e.g. JPG), no other folders or files are permitted. **Example** Structure of the SIARD file (schematic) **ech-0165_oe.siard** content/ ... schema1/ ... table6/ table6.xml table6.xsd table7/ table7.xml table7.xsd lob1[11]/ record0.xml record1.xml ...	M

[11] In this example, column 2 contains additional lob files that are accordingly stored in `lob1/`.

ID	Description of requirement	M/O
	Recommendation *It is advisable to normalise the lob folders and lob files and to use, for example,* `lob1/` *and* `record0.bin`, `record0.txt`, or `record0.xml` *instead of the actual name,* or a file extension associated with the MIME type of the lob files in case this is known *(see restrictions under P_4.2-6).*	
P_4.2-4	In order to facilitate the recognition of the SIARD Format (e.g. by PRONOM) an empty folder `/header/siardversion/2.1/` identifying the version of the SIARD Format must exist .	M
P_4.2-5	The `metadata.xml` and `metadata.xsd` files must be present in the `header/` folder. Additional files, such as style sheets, are permitted. **Example** Structure of the SIARD file (schematic) **ech-0165_oe.siard** content/ ... header/ metadata.xml metadata.xsd siardversion/ 2.1/ ...	M
P_4.2-6	All file and folder names referring to elements inside the SIARD (ZIP64) file must be structured as follows: The name must begin with a letter [a-z or A-Z] and must then contain only the following characters: • a-z • A-Z • 0-9 • _ • . (may only be used to separate the name from the extension) ***Recommendation*** *Where possible, the length of the file and folder names should not exceed 20 characters to avoid problems with excessively long path lengths in Windows.*	M

4.3 Correspondence between metadata and table data

ID	Description of requirement	M/O
P_4.3-1	The structure prescribed in the `metadata.xml` must be identical to that in the `content/` folder. **Example** 	M
P_4.3-2	The number of columns in a table specified in `metadata.xml` must be identical to that in the corresponding `table[number].xsd` file. **Example** 	M

<table>
<tr><th>ID</th><th>Description of requirement</th><th>M/O</th></tr>
<tr><td>P_4.3-3</td><td>The data type information on the column definitions in <code>metadata.xml</code> must be identical to that in the corresponding <code>table[number].xsd</code> file.

The SQL:2008 built-in data types[12] are converted into XML data types in the <code>table[number].xsd</code> schema files in accordance with the following table.
<table>
<tr><th>SQL:2008</th><th>XML</th></tr>
<tr><td>BIGINT</td><td>xs:integer</td></tr>
<tr><td>BINARY LARGE OBJECT(...), BLOB(...)</td><td>blobType[13]</td></tr>
<tr><td>BINARY VARYING(...), VARBINARY(...)</td><td>xs:hexBinary / clobType[13]</td></tr>
<tr><td>BINARY(…)</td><td>xs:hexBinary / blobType[13]</td></tr>
<tr><td>BOOLEAN</td><td>xs:boolean</td></tr>
<tr><td>CHARACTER LARGE OBJECT(...), CLOB(...)</td><td>clobType[13]</td></tr>
<tr><td>CHARACTER VARYING(...),
CHAR VARYING(...), VARCHAR(...)</td><td>xs:string / clobType[13]</td></tr>
<tr><td>CHARACTER(...), CHAR(...)</td><td>xs:string / clobType[13]</td></tr>
<tr><td>DATE</td><td>dateType</td></tr>
<tr><td>DECIMAL(...), DEC(...)</td><td>xs:decimal</td></tr>
<tr><td>DOUBLE PRECISION</td><td>xs:double</td></tr>
<tr><td>FLOAT(p)</td><td>xs:double</td></tr>
<tr><td>INTEGER, INT</td><td>xs:integer</td></tr>
<tr><td>INTERVAL <start> [TO <end>]</td><td>xs:duration</td></tr>
<tr><td>NATIONAL CHARACTER LARGE OBJECT(...),
NCHAR LARGE OBJECT(...), NCLOB(...)</td><td>clobType[13]</td></tr>
<tr><td>NATIONAL CHARACTER VARYING(...),
NATIONAL CHAR VARYING(...),
NCHAR VARYING(...)</td><td>xs:string / clobType[13]</td></tr>
<tr><td>NATIONAL CHARACTER(...), NCHAR(...),
NATIONAL CHAR(...),</td><td>xs:string / clobType[13]</td></tr>
<tr><td>NUMERIC(...)</td><td>xs:decimal</td></tr>
<tr><td>REAL</td><td>xs:float</td></tr>
<tr><td>SMALLINT</td><td>xs:integer</td></tr>
<tr><td>TIME(...)</td><td>timeType</td></tr>
<tr><td>TIME WITH TIME ZONE(...)</td><td>timeType</td></tr>
<tr><td>TIMESTAMP(...)</td><td>dateTimeType</td></tr>
<tr><td>TIMESTAMP WITH TIME ZONE(...)</td><td>dateTimeType</td></tr>
<tr><td>XML</td><td>clobType[13]</td></tr>
</table></td><td>M</td></tr>
</table>

[12] BIT and BIT VARYING are data types that originated in prior SQL definitions and have been replaced by BOOLEAN and BINARY in SQL:2008. BIT(1) is converted to BOOLEAN, BIT(n) is converted to BINARY((n+7/8).

[13] For the XML data types *blobType* and *clobType* see G_3.1-1.

ID	Description of requirement	M/O
	Example  All date and time types are specified in the UTC “time zone”. It is recommended, that they are terminated with a “Z”. The dateType is a restriction of xs:date in UTC to years between 0001 and 9999 (SQL:2008 restriction). The timeType is a restriction of xs:time to the UTC “time zone”. The dateTimeType is a restriction of xs:dateTime in the UTC “time zone” to years between 0001 and 9999 (SQL:2008 restriction). The clobType is an extension of xs:string. No additional attributes are required for inlined values, where the CLOB value is stored directly. If the CLOB value is stored in a separate file the *file* and *length* attributes are mandatory, and the *digestType* and *digest* attributes are optional. The value of the *file* attribute is the (URL-encoded) file URI (possibly relative to the nearest lobFolder), where the CLOB is stored. The value of the *length* attribute is the *length in (UTF-8)*, and the optional messageDigest attribute contains integrity information according to the equally optional digestType attribute. The blobType is an extension of xs:hexBinary. No additional attributes are required for inlined values, where the BLOB value is stored directly. If the BLOB value is stored in a separate file the *file* and *length* attributes are mandatory, and the *digestType* and *digest* attributes are optional. The value of the *file* attribute is the (URL-encoded) file URI (possibly relative to the nearest lobFolder), where the BLOB is stored. The value of the length attribute is the *length in bytes*, and the optional messageDigest attribute contains integrity information according to the equally optional digestType attribute.	
P_4.3-4	The named DISTINCT data types are converted to the XML data type in the `table[number].xsd` schema files which would be used for representing their base types.	M
P_4.3-5	Arrays are converted in the `table[number].xsd` schema files into a sequence of structured XML elements `<a1>, <a2>, …` which are converted to the XML data type corresponding to the base type of the array. **Example** See example `table0.xsd` in appendix D.3c.	M

ID	Description of requirement	M/O
P_4.3-6	The named user-defined data type (UDT) is converted in the `table[number].xsd` schema files into a sequence of structured XML elements `<u1>`, `<u2>`, … which are converted to the XML data type corresponding to the type of each attribute. **Example** See example `table0.xsd` in appendix D.3c.	M
P_4.3-7	The nullable information on the column definitions in the `metadata.xml` must be identical to that in the corresponding `table[number].xsd` file. **Example**  **Note** The SQL:2008 notation "<nullable>true</nullable>" becomes “minOccurs="0"” in XML. "<nullable>false</nullable>" corresponds to "minOccurs="1"” in XML. However, as “minOccurs=”1”” is the default value, it is often omitted. No indication of “<nullable>” implies “<nullable>true</nullable>”.	M
P_4.3-8	The column sequence in the `metadata.xml` must be identical to that in the corresponding `table[number].xsd`.	M
P_4.3-9	The field sequence in the table definition of `metadata.xml` must be identical to the field sequence in the corresponding `table[number].xsd`.	M

ID	Description of requirement	M/O
P_4.3-10	The number of lines in a table in `metadata.xml` must be identical to the number of lines in the corresponding `table[number].xml`. The number of lines in a table in `metadata.xml` must fit into the area specified in the corresponding `table[number].xsd`. **Example**  ***Recommendation*** *It is advisable to use the range 0 to infinity (maxOccurs="unbounded" minOccurs="0") in the* `table[number].xsd`*. This avoids problems when validating* `table[number].xml` ***against*** `table[number].xsd`*.*	M

5 Requirements for metadata

The metadata in the SIARD archive store the structure of the archived database and indicate where different table data are to be found in the archive.

All the metadata are collated in a single `metadata.xml` file in the `header/` folder. This file has a hierarchical structure.

There is a schema definition `metadata.xsd` for the `metadata.xml` file. This is also stored in the `header/` folder.

ID	Description of requirement	M/O
M_5.0-1	The schema definition `metadata.xsd` must be complied with for the `metadata.xml` file. This means that `metadata.xml` must pass validation against `metadata.xsd`.	M

The contents of the individual levels are defined below.

5.1 Database level metadata

The `metadata.xml` file contains the following global information at database level:

ID	Description of requirement	M/O
M_5.1-1	All metadata that are designated as mandatory in `metadata.xsd` at database level must be completed accordingly.	M

The following database metadata are stored in the `metadata.xml` file:

Identifier	Meaning	M/O
version	SIARD format version	M
dbname	Short database identifier	M
description	Description of the meaning and content of the database as a whole	O
archiver	Name of the person who carried out the archiving of the table data from the database	O
archiverContact	Contact details (telephone, e-mail) of the person who carried out the archiving of the table data from the database	O
dataOwner	Owner of the data in the database; the institution or person that, at the time of archiving, has the right to grant usage rights for the data and is responsible for compliance with legal obligations such as data protection guidelines	M
dataOrigin-Timespan	Origination period of the data in the database; approximate indication in text form	M

Identifier	Meaning	M/O
lobFolder	A “file:” URI representing the base URI for relative URIs indicating the possibly external storage location of large objects. If it is missing, default value of the root folder inside the ZIP file is assumed. Relative *lobFolder* URIs in the column metadata are relative to this value. **Note** If the “file:” URI refers to an extended file system, where ZIP files are treated as folders, the relative URI “..” refers to the external folder, where the SIARD archive resides. If such a file system extension is not supported, absolute “file:” URIs must be used for specifying an external storage location for LOB files. It is strongly recommended to choose all column *lobFolder* entries and all LOB *file* attributes as relative URIs. Thus, on relocation of the SIARD file or its information package, only this global URI must be changed to point to the new location.	O
producerApplica-tion	Name and version of the application that downloaded the SIARD file.	O
archivalDate	Date on which the table data were archived	M
messageDigest	Consists of `digestType` (MD5, SHA-1, or SHA-256) and the corresponding `digest`. The `digest` represents a binary buffer as a hexadecimal string, or alternatively, in the case of SHA-1 or SHA-256, a base64 string. Whether hexadecimal or a base64 encoding is used depends on the length of the digest and of the string. The digest is calculated over the `content/` folder. More than one message digest (based on different algorithms) can be stored. If no message digest is stored, then the integrity must be assured by storing something like a message digest outside the SIARD file[14]. **Example** See example `metadata.xml` in appendix D.2. ***Recommendation*** *If the message digest option is used, the following must be implemented:* *The content and header directories are stored in the ZIP file as separate (empty)* `content/` *and* `header/` *entries. To ensure that the integrity of the primary data can be checked, the entry for the header directories must be inserted after all the primary data in the* `content/` *entry and before all the other metadata entries. The message digest mentioned below is computed from offset 0 to the offset of the* `header/` *entry of the SIARD archive.*	O
clientMachine	DNS name of the (client) computer on which the archiving was carried out	O

[14] A message digest code that is stored inside the SIARD file is not, on its own, a guarantee of integrity, for it can be counterfeited by an attacker counterfeiting the SIARD file. This can only be circumvented by storing the message digest code externally. However, internally producing a metadata-independent message digest code at downloading time can support external storage.

Identifier	Meaning	M/O
databaseProduct	Database product and version from which the archiving of the table data was carried out	O
connection	Connection string used to archive the table data	O
databaseUser	Database user ID of the user of the SIARD tool for archiving the table data from the database	O
schemas	List of schemas in the database	M
users	List of database users	M
roles	List of database roles	O
privileges	List of user and role privileges	O

5.2 Schema level metadata

The schema metadata are archived in the `metadata.xml` file as with the global information on the database.

ID	Description of requirement	M/O
M_5.2-1	All metadata that are designated as mandatory in `metadata.xsd`at schema level must be completed accordingly.	M

The following schema metadata are stored in the `metadata.xml`file:

Identifier	Meaning	M/O
name	Schema name in the database	M
folder	Name of the schema folder under `content/` in the SIARD archive	M
types	List of (named) advanced or structured types in the schema	O
description	Description of the meaning and content of the schema	O
tables	List of the tables in the schema	O
views	List of the views stored in the schema	O
routines	List of the routines (formerly “stored procedures”) in the schema	O

5.3 Type level metadata

ID	Description of requirement	M/O
M_5.3-1	The type metadata of a schema can be archived in the `metadata.xml` file	O

The following type metadata are stored in the `metadata.xml`file if an advanced or structured data type is archived:

Identifier	Meaning	M/O
name	Type name in the schema	M
category	Category of advanced or structured type (“distinct” or “udt”).	M
underSchema	If the type is based on a super type, schema name of super type	O
underType	If the type is based on a super type, name of super type	O
instantiable	True, if type can be instantiated, false otherwise	M
final	True, if no sub types can be created to this type, false otherwise	M
base	Name of predefined base type if category is “distinct”	O
attributes	List of attributes, if category is “ “udt”	O
description	Description of the meaning and content of the data type	O

5.4 Attribute level metadata

ID	Description of requirement	M/O
M_5.4-1	All metadata that are designed as mandatory in `metadata.xml` at attribute level must be completed accordingly.	M

The following attribute metadata are stored in the `metadata.xml`file:

Identifier	Meaning	M/O
name	Name of the attribute	M
type	SQL:2008 built-in data type of the attribute	O
typeOriginal	Original column type for the built-in type **Note** As the various database programs that describe themselves as SQL-compliant permit very different data types, the *original* type is listed here as well as the SQL:2008 type. A translation of the proprietary types to SQL:2008 types is to be defined and documented in the corresponding application for each database program that supports the SIARD format.	O
nullable	Nullable element of the attribute ***Recommendation*** *Use of the nullable element is discouraged.*	O
typeSchema	Schema of advanced or structured data type	O
typeName	Name of advanced or structured data type	O
defaultValue	Default value of attribute	O
description	Description of the meaning and function of the routine	O
cardinality	(Maximum) number of elements if the attribute is an array.	O

5.5 Table level metadata

Like the global information on the database and the schema metadata, table level metadata are archived in the `metadata.xml` file.

ID	Description of requirement	M/O
M_5.5-1	All metadata that are designated as mandatory in `metadata.xsd`at table level must be completed accordingly.	M

The following table metadata are stored in the `metadata.xml`file:

Identifier	Meaning	M/O
name	Table name in the schema	M
folder	Name of the table folder in the schema folder	M
description	Description of the meaning and content of the table	O
columns	List of the columns in the table	M
primaryKey	Primary key of the table	O
foreignKeys	List of the foreign keys in the table	O
candidateKeys	List of the candidate keys in the table	O
checkConstraints	List of the constraints in the table	O
triggers	List of the triggers in the table	O
rows	Number of datasets	M

5.6 Column level metadata

Like the global information on the database, the schema metadata and the table level metadata, the column level metadata are archived in the `metadata.xml`file. Column metadata describe a column in a table or a view.

ID	Description of requirement	M/O
M_5.6-1	All metadata that are designated as mandatory in the `metadata.xsd` at column level must be completed appropriately.	M

The following column metadata are stored in the `metadata.xml`file:

Identifier	Meaning	M/O
name	Column name in the table or view. The column name must be unambiguous within a given table.	M
lobFolder	Name of the LOB folder given as a relative or absolute “file:” URI – possibly in the external file system. It may be used for internal as well as external storage of large objects. **Example** See the example `metadata.xml` in appendix D.2. **Note** This entry is only meaningful, if the column is a LOB column (e.g. type BLOB, CLOB or XML). If it is missing, it is assumed to equal “.”, e.g. to refer to the same folder as the *lobFolder* on the database level. Otherwise its value must be a – preferably relative – “file:” URI, indicating the folder, where the files of this LOB column are to be stored. If this value is a relative URI, it is assumed to be relative to the global *lobFolder* entry at the database level. The relative *file* attributes of the cells in this column are interpreted as being relative to this folder.	O
type	SQL:2008 built-in data type of the column **Note** If the data type of this column is a built-in data type, this field must be used. Otherwise the field `typeName` must refer to a defined type in the types list.	M

Identifier	Meaning	M/O
typeOriginal	Original column type **Note** As the various database programs that describe themselves as SQL-compliant permit very different data types, the *original* type is listed here as well as the SQL:2008 type. A translation of the proprietary types to SQL:2008 types is to be defined and documented in the corresponding application for each database program that supports the SIARD format.	O
nullable	Optional entry	O
typeSchema	Schema of named type if the column is not a built-in data type and the named data type is not defined in the same schema as the table of this column.	O
typeName	Name of the advanced or structured data type of this column	O
fields	List of fields in the column, if the column is either an array or a structured data type of category “udt”	O
defaultValue	Default value of the column	O
mimeType	MIME type of this column, if it is a BLOB column and all records contain files of the same MIME type in this column. This purely advisory element helps choosing the correct viewer for binary objects. It can be filled in manually or by the downloading program, which uses some format recognition mechanism.	O
description	Description of the meaning and content of the column	O
cardinality	(Maximum) number of elements if it is an array.	O

5.7 Field metadata

ID	Description of requirement	M/O
M_5.7-1	The field metadata of a column or a field can be archived in the `metadata.xml` file	O

The following field metadata are stored in the `metadata.xml` file if a column or a field is an array or an advanced or structured data type of category “udt”:

Identifier	Meaning	M/O
name	Field name in the column or field. The field name must be unique within the same column. ***Recommendation*** *For type “udt” containers (column or field) the fieldname should be identical to the corresponding attribute name. For array containers the field name shoud be the name of the container followed by the array index in square brackets, starting at 1, i.e. for instance “Punkt[1]”, “Punkt[2]”, etc.*	M
lobFolder	Name of the LOB folder given as a relative or absolute “file:” URI – possibly in the external file system. It may be used for internal as well as external storage of large objects. **Note** This entry is only meaningful, if the field is a LOB field (e.g. type BLOB, CLOB or XML). If it is missing, it is assumed to equal “.”, e.g. to refer to the `lobFolder` element of the enclosing column or field element. Otherwise its value must be a – preferably relative – “file:” URI, indicating the folder, where the files of this LOB field are to be stored. If this value is a relative URI, it is assumed to be relative to the `lobFolder` element of the enclosing element. The *file* attributes of the cells in this column or field are interpreted as being relative to this folder.	O
fields	List of fields in the field, if the field is an array or a structured data type of category or “udt”	O
mimeType	MIME type of this field, if it is a BLOB field and all records contain files of the same MIME type in this field. This purely advisory element helps choosing the correct viewer for binary objects. It can be filled in manually or by the downloading program, which uses some format recognition mechanism.	O
description	Description of the meaning and content of the field	O

5.8 Primary key metadata

Primary key is defined as a unique key that identifies a record.

ID	Description of requirement	M/O
M_5.8-1	The primary key metadata of a table can be archived in the `metadata.xml` file	O

The following primary key metadata are stored in the `metadata.xml` file if a primary key is archived:

Identifier	Meaning	M/O
name	Name of the primary key	M
column	List of the columns in the primary key	M
description	Description of the meaning and content of the primary key	O

5.9 Foreign key metadata

ID	Description of requirement	M/O
M_5.9-1	The foreign key metadata in a table can be archived in the `metadata.xml` file	O

The following foreign key metadata are stored in the `metadata.xml` file if a foreign key is archived:

Identifier	Meaning	M/O
name	Name of the foreign key	M
referenced-Schema	Schema of the table referenced	M
referencedTable	Table that is referenced **Note** The external table name referenced can be of the table or schema.table type. Delimited identifiers are enclosed in quotation marks.	M
reference	List of columns and referenced columns	M
matchType	Match type (FULL, PARTIAL or SIMPLE)	O
deleteAction	Delete action, e.g. CASCADE **Note** The delete and change actions contain the actions permitted by the SQL:2008 standard.	O
updateAction	Change action, e.g. SET DEFAULT	O

Identifier	Meaning	M/O
description	Description of the meaning and content of the foreign key	O

5.10 Reference metadata

ID	Description of requirement	M/O
M_5.10-1	The metadata of the references used in the foreign key can be archived in the `metadata.xml` file	O

The following reference metadata are stored in the `metadata.xml` file if a foreign key is archived:

Identifier	Meaning	M/O
column	Name of the column	M
referenced	Name of the referenced column	M

5.11 Candidate key metadata

Candidate key is defined as a unique key that is a candidate for a primary key. Primary keys as well as candidate keys are of the same type uniqueKeyType in metadata.xsd. Therefore, the requirements for candidate keys are the same as those for primary keys (see M_5.8-1).

ID	Description of requirement	M/O
M_5.11-1	The metadata of the candidate key of a table can be archived in the `metadata.xml` file	O

The following candidate key metadata are stored in the `metadata.xml`file if a candidate key is archived:

Identifier	Meaning	M/O
name	Name of the candidate key	M
column	List of the columns in the candidate key	M
description	Description of the meaning and content of the candidate key	O

5.12 Check constraint metadata

The check constraint consists of a condition that is to be examined. This is indicated as an BOOLEAN expression (having the value *true*, *false* or *unknown*) in SQL:2008 syntax.

ID	Description of requirement	M/O
M_5.12-1	The metadata of the check constraint of a table can be archived in the `metadata.xml`file	O

The following check constraint metadata are stored in the `metadata.xml` file if a check constraint is archived:

Identifier	Meaning	M/O
name	Name of the check constraint	M
condition	Condition of the check constraint	M
description	Description of the meaning and content of the check constraint	O

5.13 Trigger level metadata

ID	Description of requirement	M/O
M_5.13-1	The trigger metadata of a table can be archived in the `metadata.xml`file	O

The following trigger metadata are stored in the `metadata.xml`file if a trigger is archived:

Identifier	Meaning	M/O
name	Trigger name in the table	M
actionTime	BEFORE, AFTER or INSTEAD OF	M
triggerEvent	INSERT, DELETE, UPDATE [OF <trigger column list>]	M
aliasList	<old or new value alias list>	O
triggeredAction	<triggered action>	M
description	Description of the meaning and content of the trigger	O

5.14 View level metadata

ID	Description of requirement	M/O
M_5.14-1	The view metadata of a schema can be archived in the `metadata.xml` file	O

The following view metadata are stored in the `metadata.xml` file if a view is archived:

Identifier	Meaning	M/O
name	Name of the view in the schema	M
columns	List of the column names in the view **Note** The column metadata of a view are structured identically to those of a table.	M
query	SQL:2008 query that defines the view	O
queryOriginal	Original SQL query that defines the view **Note** As the various database programs that describe themselves as SQL-compliant permit very different query syntaxes, the original query is listed here as well as the SQL:2008 query. A translation of the proprietary query syntax to SQL:2008 types is to be defined and documented in the corresponding application for each database program that supports the SIARD format.	O
rows	Number of records	O
description	Description of the meaning and content of the view	O

5.15 Routine level metadata

ID	Description of requirement	M/O
M_5.15-1	The routine metadata of a schema can be archived in the `metadata.xml` file	O

The following routine metadata are stored in the `metadata.xml`file if a routine is archived:

Identifier	Meaning	M/O
specificName	Specific name that uniquely identifies the routine in the schema[15].	M
name	Routine name in the schema	M
description	Description of the meaning and content of the routine	O
source	Original source code of the routine (VBA, PL/SQL, JAVA) **Note** Since many database programs have proprietary routines that cannot be transformed into an SQL:2008-compliant query, the original source code of the routine (e.g. in PL/SQL for Oracle databases, VBA for MS Access modules) can be archived here.	O
body	SQL:2008-compliant source code of the routine	O
characteristic	Characteristic of the routine	O
returnType	Return type of the routine (if it is a function)	O
parameters	List of parameters	O

5.16 Parameter metadata

ID	Description of requirement	M/O
M_5.16-1	The parameter metadata that are used in the routine can be archived in the `metadata.xml` file	O

The following parameter metadata are stored in the `metadata.xml`file if a routine is archived:

Identifier	Meaning	M/O
name	Name of the parameter	M
mode	Mode of the parameter (IN, OUT or INOUT)	M

[15] The introduction of object-oriented elements into SQL:1999 has made “overloading” possible, allowing two different routines (procedures or functions) to have the same name, as long as their parameter lists differ. Therefore the requirement that a routine be unique within a schema cannot stand. The “specific name” has been introduced instead in order to uniquely identify the routine in the schema.

Identifier	Meaning	M/O
type	SQL:2008 built-in data type of the parameter **Note** If the data type of this column is a built-in data type, this field must be used. Otherwise the field `typeName` must refer to a defined type in the types list.	O
typeOriginal	Original parameter type **Note** As the various database programs that describe themselves as SQL-compliant permit very different data types, the *original* type is listed here as well as the SQL:2008 type. A translation of the proprietary types to SQL:2008 types is to be defined and documented in the corresponding application for each database program that supports the SIARD format.	O
typeSchema	Schema of named type if the parameter is not a built-in data type and the named data type is not defined in the same schema as the table of this column.	O
typeName	Name of the advanced or structured data type of this parameter	O
description	Description of the meaning and function of the routine	O
cardinality	(Maximum) number of elements if the parameter is an array.	O

5.17 User level metadata

ID	Description of requirement	M/O
M_5.17-1	The user metadata can be archived in the `metadata.xml` file	O

The following user metadata are stored in the `metadata.xml` file:

Identifier	Meaning	M/O
name	Name of the user	M
description	Description of the significance and function of the user	O

5.18 Role level metadata

ID	Description of requirement	M/O
M_5.18-1	The role metadata can be archived in the `metadata.xml` file	O

The following role metadata are stored in the `metadata.xml` file:

Identifier	Meaning	M/O
name	Name of the role	M
admin	Administrator of the role (user or role)	M
description	Description of the meaning and function of the role	O

5.19 Privilege level metadata

ID	Description of requirement	M/O
M_5.19-1	The privilege metadata can be archived in the `metadata.xml` file	O

The following privilege metadata are stored in the `metadata.xml` file:

Identifier	Meaning	M/O
type	Privilege granted (e.g. SELECT)	M
object	Object to which the privilege is to be applied	O
grantor	Authorised grantor of the privilege	M
grantee	Recipient of the privilege (user or role)	M
option	Grant option (ADMIN or GRANT)	O
description	Description of the significance and function of the grant	O

6 Requirements for table data

As described above, the table data of an archived relational database are located in the `content/` folder in the document root of the SIARD archive. They are filed there in the schema and table folder concerned.

Table data are always stored in an XML file. An XML schema definition is generated for each table that indicates the XML storage format of the table data. This means that for each table there is a `table[number].xml` file to the schema definition `table[number].xsd`.

ID	Description of requirement	M/O
T_6.0-1	All the table data (primary data) must meet the consistency requirements of SQL:2008. A SIARD file that validates syntactically against the various XSDs but infringes the SQL standard semantically is not compliant with this format description. In particular, the table values must correspond to the constraints of the SQL types in the metadata. Additionally, the primary, candidate and foreign key conditions and nullability conditions stored in the metadata must all be met.	M
T_6.0-2	The schema definition `table[number].xsd` must be complied with for the `table[number].xml` file. This means that `table[number].xml` must pass validation against `table[number].xsd`.	M

6.1 Table schema definition

The `table[number].xsd` file contains the following schema definitions for a table:

ID	Description of requirement	M/O
T_6.1-1	There must be an XML schema definition for each table that indicates the XML storage format of the table data.	M
T_6.1-2	This schema definition reflects the SQL schema metadata of the table and indicates that the table is stored as a sequence of lines containing a sequence of column entries with various XML types. The name of the table tag is *table*, that of the dataset tag is *row*, while the column tags are called *c1, c2, ...* The column tags always start with c1 and increase by 1. There must be no gap, because a NULL value is expressed by a missing corresponding column in the XML file. **Example** See the example `table2.xsd` in Appendix D.3a.	M
T_6.1-3	The type mapping to be used in table schema definitions is specified in P_4.3-3. Apart from XML Schema standard types the following special type are used: clobType, blobType, dateType, timeType, dateTimeType.	M

ID	Description of requirement	M/O
T_6.1-4	Multiple cell values of advanced or structured types are to be stored as separate elements inside the cell tags. The names of the individual elements of an ARRAY are a1, a2, …. The names of the individual elements of a UDT are u1, u2, …. The names always start with a1 or u1, respectively, and increase by 1. There must be no gap, because a NULL value is expressed by a missing corresponding column in the XML file. **Example** See the example `table0.xsd` in appendix D.3c.	M

6.2 Large object data cells

ID	Description of requirement	M/O
T_6.2-1	Large objects can be stored inline in the `table[number].xml` file, internally as separate file entries inside the SIARD archive, or externally as standalone files in the file system	M

If the Large Object is stored as a separate file (either internally or externally) the *file* and *length* attributes must be stored in a LOB cell in the `table[number].xsd` file. These attributes are optional if the Large Object is stored inline.

Identifier	Meaning	M/O
file	If the large object is not inlined, this element indicates the location and name of the large object file in this cell or cell attribute as a “file:” URI. If it is a relative URI it is interpreted as relative to the enclosing element’s (column or attribute) *lobFolder*.	M[16]
length	Length (for BLOBs in bytes, for CLOBs and XML in characters)	M[16]
digestType	Contains the type of integrity information (digest): “MD5”, “SHA-1” or “SHA-256”. ***Recommendation*** *This attribute, as well as the digest attribute, should be completed for all Large Objects stored as a separate file.*	O

[16] O if the Large Object is stored inline in the `table[number].xml` file.

Identifier	Meaning	M/O
digest	Contains the integrity information of the CLOB or BLOB. ***Recommendation*** *This attribute, as well as the digestType attribute, should be completed for all Large Objects stored as a separate file.*	O

6.3 Date and timestamp data cells

ID	Description of requirement	M/O
T_6.3-1	Dates and timestamps must be restricted to the years 0001-9999 according to the SQL:2008 specification. This restriction is enforced in the definitions of *dateType* and *dateTimeType*.	M
T_6.3-2	Dates, times and timestamps may need to be stored with terminating Z in UTC. This limitation is enforced in the definitions of dateType, timeType, and dateTimeType. ***Recommendation*** *Store all dates, times, and timestamps with terminating Z.*	M

6.4 Table data

The `table[number].xml` file contains the following table data for this table:

ID	Description of requirement	M/O
T_6.4-1	The table data for each table must be stored in an XML file.	M
T_6.4-2	The *table* file consists of *row* elements containing the data of a line subdivided into the various columns (*c1, c2* ...). **Example** See the example table2.xml in Appendix D.4a.	M
T_6.4-3	If a cell of a column or field is NULL, it must be omitted. If it equals ‘’, the string of length 0, it must be present but empty.	M
T_6.4-4	If a cell of a column contains a complex value (ARRAY, UDT), it is represented by a sequence of sub elements of the cell (a1,a2, … for ARRAYs, u1, u2, … for UDTs) which in turn contain their respective values. These values may again be complex. **Example** See the example `table0.xml` in appendix D.4c.	O

ID	Description of requirement	M/O
T_6.4-5	If a table contains data of the large object types (BLOB, CLOB, or XML ...) separate files may be produced for these and the storage location of the file is stored instead of the cell content. The decision when to store large object data in separate files rather than inlining them is at the discretion of the software producing the SIARD archive. To avoid creating empty folders, folders are only created when they are necessary, i.e. contain data. If a large object is stored in a separate file, its cell element must have attributes *file*, *length* and *digest*. Here *file* is a "file:" URI relative to the *lobFolder* element of the column or attribute metadata. The *length* contains the length in bytes (for BLOBs) or characters (for CLOBs or XMLs). The digest records a message digest over the LOB file, making it possible to check integrity of the SIARD archive, even when some LOBs are stored externally. **Example** See the example `table7.xml` in Appendix D.4b. ***Recommendation*** *It is strongly recommended to either inline all large objects in one column or none.* *It is advisable to normalise the lob folders and lob files and to use, for example,* `lob4/` *and* `record0.bin` *or* `record0.txt` *instead of the actual name.*	M

7 Version and validity of the specification

The current version of the Specification is 2.1.

8 Change management process

The change management process for this standard follows [eCH-0150], scenario 3.

9 Exclusion of liability / notice regarding third-party rights

KOST accepts no liability for decisions or measures taken by the user on the basis of this document. KOST can offer no warranty or guarantee that the information and documents made available are up to date, complete, correct or free from errors. To the extent permitted by law, no liability is accepted in respect of loss or damage incurred by the user as the result of using this standard.

10 Copyright

The authors of the present standard retain intellectual property rights in respect thereof. However, they undertake to make their relevant intellectual property or rights in respect of the intellectual property of others available, to the extent possible, free of charge for unrestricted use and further development.

Appendix B – Abbreviations and Glossary

Term	Description
AIP	Archival Information Package. AIPs result from SIPs during the process of archiving digital documents. They represent the form of information packages in which digital documents are stored in the digital repository.
Archive	1. Institution or body responsible for cataloguing, keeping and preserving archive records and making them available. 2. Archived documents of an organisation. 3. Building or institution that was constructed or established for the purpose of archiving documents. 4. Term for a file that contains other files. See also archive file and the synonym container file.
Archive records	Refers to documents that have been accepted by the archive for safekeeping, or that are independently archived by other bodies in accordance with the same principles.
Database	A database normally consists of one or more database schemas as well as defined access rights of individual users and roles to certain parts of the database. In SQL:2008 users and roles can be holders of privileges. A relational database therefore consists of a number of structured database objects (e.g. schema, view) and the table content. A database schema is a kind of namespace prefix. A database catalogue contains the metadata of all the schemas in the catalogue. The catalogue level in SQL:2008 corresponds to the database “document” that can be converted into an archival format using SIARD.
DIP	Dissemination Information Package: According to OAIS, a DIP is a container for dossiers that are requested by a user via an ordering procedure.
DNS	Domain Name System, a distributed database that administers the name space in the Internet.
Documents	Documents are all recorded information, irrespective of the medium, that is received or produced in the fulfilment of public duties, as well as all finding aids and supplementary data that are required in order to understand and use this information.
Dossier	All the documents relating to a specific business matter. A dossier basically corresponds to a business matter. However, by combining similar business matters or dividing dossiers into subdossiers, this basic structure can be adapted to meet the corresponding needs. The compilation of dossiers is carried out on the basis of the classification system.
Information package	A conceptual container made up of optional content information and optional associated preservation metadata. It includes packaging information that distinguishes the content information and the package description from each other, identifies them and enables the content information to be searched for.
LOB	“Large object” used generically for cell content of a CLOB, BLOB or XML column which might be represented by a separate file.
Long-term archiving	Storing digital information and maintaining its long-term availability, normally without a time limit. In addition to retaining the bit stream of the archived information it also includes the ability to interpret and display it in human-readable and understandable form at all times.
MD5	Message-Digest Algorithm 5
Metadata	Metadata can be described as “information about primary data” (data about data), since they have a descriptive nature.

Term	Description
OAIS	Open Archival Information System, ISO 14721:2003. A reference model that describes an archive as an organisation in which people and systems work together to preserve information and make it available to a designated community.
Primary data	Primary data are the data that make up the content of documents. Within a SIARD file, the table data perform the function of primary data
Records creator	Refers to the authority or organisational unit that created and managed the documents.
Routines	SQL routines (also known as stored procedures) are mainly important to understanding the view queries in which they can occur as partial expressions.
Schemas	Schemas are containers for the tables, views and routines.
SFA	Swiss Federal Archives
SHA1	Secure Hash Algorithm 1
SIP	Submission Information Package: According to OAIS, SIPs are information packages that are submitted to the archive by the records-creating authorities. They contain digital documents (primary data and metadata).
Tables	Tables consist of a table definition with fields that assign a name and type to each column in the table, datasets that contain the actual table data, an optional primary key, foreign keys that ensure referential integrity, candidate keys that serve to identify a dataset, and constraints that guarantee consistency. Triggers may optionally be defined for a table.
UTF	Unicode Transformation Format
Views	Views are standard queries stored in the database. The query result is a table that also contains fields and data sets.
XSD	XML Schema Definition

Appendix C – List of Standards Used

eCH-0150	eCH-0150 Change und Release Management von eCH-Standards http://www.ech.ch/
RFC 1738	URL specification – in particular the “file:” URL/URI https://www.ietf.org/rfc/rfc1738.txt
RFC 1951	Specification of the “deflate” algorithm. https://www.ietf.org/rfc/rfc1951.txt
SQL:2008	ISO/IEC 9075(1-4,9-11,13,14):2008: Information technology -- Database languages – SQL http://www.iso.org/iso/home/store/catalogue_ics/catalogue_detail_ics.htm?csnumber=53681
Unicode	Unicode 6.1.0 Unicode, Inc. http://www.unicode.org/versions/Unicode6.1.0/ (corresponds to ISO/IEC 10646:2012: Information technology -- Universal Coded Character Set (UCS) http://www.iso.org/iso/home/store/catalogue_tc/catalogue_detail.htm?csnumber=56921)
XML	Extensible Markup Language (XML), 1.1 (Second Edition) W3C Recommendation 16 August 2006, edited in place 29 September 2006 http://www.w3.org/TR/2006/REC-xml11-20060816/ (corresponds to ISO/IEC 19503:2005: Information technology -- XML Metadata Interchange (XMI), http://www.iso.org/iso/home/store/catalogue_tc/catalogue_detail.htm?csnumber=32622)
ZIP	ZIP File Format Specification, Version 6.3.3 September 1, 2012 PKWARE Inc. http://www.pkware.com/documents/casestudies/APPNOTE.TXT

Appendix D – Excerpts of example file ech-0165_oe.siard

The listings in Appendix D are taken from the SIARD file `ech-0165_oe.siard` that is attached to the SIARD Format Specification v2.1.

D.1 metadata.xsd

The XML schema definition `metadata.xsd` defines the structure of the `metadata.xml` file in the `header/` folder.

```
<?xml version="1.0" encoding="utf-8"?>
<!-- ====================================================================
XML schema for meta data of the SIARD Format 2.1
Application: Software-Independent Archival of Relational Databases
Platform   : XML 1.0, XML Schema 2001
Description: This XML schema definition defines the structure
          of the meta data in the SIARD format 2.1.

D.3 Examples of the XML schema definition of a table

SIARD generates an XML schema definition for each table that assigns the correct XML data types to the columns.

D.3a table2.xsd (schema definition of a simple table)

```
<?xml version="1.0" encoding="utf-8" standalone="no"?>
<xs:schema xmlns="http://www.bar.admin.ch/xmlns/siard/2/table.xsd" xmlns:xs="http://www.w3.org/2001/XMLSchema"
targetNamespace="http://www.bar.admin.ch/xmlns/siard/2/table.xsd" elementFormDefault="qualified" attributeFormDefault="unqualified"
version="2.1">
  <!-- root element is the table element -->
  <xs:element name="table">
    <xs:complexType>
      <xs:annotation>
        <xs:documentation>Root element of a table of the SIARD archive. A table consists of rows.</xs:documentation>
      </xs:annotation>
      <xs:sequence>
        <xs:element name="row" type="recordType" minOccurs="0" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:attribute name="version" type="versionType" use="required"/>
    </xs:complexType>
  </xs:element>
  <!-- simple type for version number -->
  <xs:simpleType name="versionType">
    <xs:annotation>
      <xs:documentation>versionType is constrained to "2.1" for conformity with this XML schema</xs:documentation>
    </xs:annotation>
    <xs:restriction base="xs:string">
      <xs:whiteSpace value="collapse"/>
      <xs:enumeration value="2.1"/>
      <!--  to be extended later with  <xs.enumeration value="2.2"/>  etc. -->
    </xs:restriction>
  </xs:simpleType>
  <!-- complex type record -->
  <xs:complexType name="recordType">
    <xs:annotation>
      <xs:documentation>row type of a table of the SIARD archive. A row consists of columns.</xs:documentation>
    </xs:annotation>
    <xs:sequence>
      <xs:element name="c1" type="xs:decimal"/>
      <xs:element name="c2" type="xs:string" minOccurs="0"/>
      <xs:element name="c3" type="xs:string"/>
      <xs:element name="c4" type="xs:string"/>
      <xs:element name="c5" type="xs:string" minOccurs="0"/>
      <xs:element name="c6" type="dateType"/>
      <xs:element name="c7" type="xs:string"/>
      <xs:element name="c8" type="xs:decimal" minOccurs="0"/>
      <xs:element name="c9" type="xs:decimal" minOccurs="0"/>
      <xs:element name="c10" type="xs:decimal" minOccurs="0"/>
      <xs:element name="c11" type="xs:decimal" minOccurs="0"/>
    </xs:sequence>
  </xs:complexType>
  <!-- date type between 0001 and 9999 restricted to UTC -->
  <xs:simpleType name="dateType">
    <xs:restriction base="xs:date">
      <xs:minInclusive value="0001-01-01Z"/>
      <xs:maxExclusive value="10000-01-01Z"/>
      <xs:pattern value="\d{4}-\d{2}-\d{2}Z?"/>
    </xs:restriction>
  </xs:simpleType>
</xs:schema>
```

D.3b table7.xsd (schema definition of a table with internal large objects)

```
<?xml version="1.0" encoding="utf-8" standalone="no"?>
<xs:schema xmlns="http://www.bar.admin.ch/xmlns/siard/2/table.xsd" xmlns:xs="http://www.w3.org/2001/XMLSchema"
targetNamespace="http://www.bar.admin.ch/xmlns/siard/2/table.xsd" elementFormDefault="qualified" attributeFormDefault="unqualified"
version="2.1">
  <!-- root element is the table element -->
  <xs:element name="table">
    <xs:complexType>
      <xs:annotation>
        <xs:documentation>Root element of a table of the SIARD archive. A table consists of rows.</xs:documentation>
      </xs:annotation>
      <xs:sequence>
        <xs:element name="row" type="recordType" minOccurs="0" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:attribute name="version" type="versionType" use="required"/>
    </xs:complexType>

Appendix E – Changes from version 1.0

The following changes have been introduced from version 1.0 to version 2.1.

Chapter / ID / Document	Change	RFC
passim	Optional requirements: it is specified whether a field must be filled in or can be left empty.	2013-23
passim, 5.3, 5.4, 5.7, 6.2 & 6.3	Upgrade of SQL:1999 support to SQL:2008 support	2014-110
Title page, chapters 3-6, Appendix D	All examples refer to the newly enclosed example file ech-0165_oe.siard	
Summary	Updated, explains usage of the previous version.	
1, 2	Numbering of chapters according to the new template.	
2.2, passim	ID requirement G instead of A	
G_3.2-1, G_3.4-3, P_4.2-3, passim, metadata.xsd	Adaptations regarding large objects incl. attributes *digest* und *digestType*. Support for storing large objects outside of the SIARD file.	2015-29
G_3.2-2	Deleted because it was no format definition but an organisational requirement	
G_4.1-2	Support for “deflate” as a compression mechanism	Addendum
P_4.2-4, P_4.2-5	Format identification. To complement existing identification methods an empty folder header/siardversion/2.1/ exists in order to improve understanding and identification.	2015-12
P_4.3-3, passim, metadata.xsd	Upgrade of SQL:1999 support to SQL:2008 support. The SQL:2008 abbreviations have been integrated.	2014-110
5.4, metadata.xsd	Nullable-Element of the attribute introduced	
5.6, 5.7	Folder replaced by lobfolder in the columns and fields areas	
T_6.1-2, T_6.1-4	Start of consecutive numbering has been stated more precisely	
T_6.1-3, T_6.3-2, passim, metadata.xsd	Adaptations in the date, time, and timestamp areas	
5.13, metadata.xsd	actionTime of the triggers augmented with INSTEAD OF	
metadata.xsd	metadata.xsd has been adapted in different places, for the following reasons: adjustment to SQL:2008 standard (identifiers and type elements), adaptation of regular expressions for the pre-defined data types, implementation of the changes mentioned above, adaptation to the specification, aggregation of primaryKeyType and candidateKeyType to uniqueKeyType.
